

PS 3.3

MULTI-SECTORIAL POLICIES AND PRACTICES: MITIGATION

| BACKGROUND

Climate change has complex impacts on people's health that fall into three broad categories: 1) direct impacts such as heat and extreme events; 2) indirect impacts via ecosystems which include impacts on global food supplies and changes in vector-borne disease transmission; and 3) indirect impacts via socio-economic systems exemplified by increased poverty and intensification of existing inequalities and migration. The magnitude of these impacts on health will increase in the future and their severity will depend on the effectiveness of climate mitigation and adaptation actions. All people are exposed to the hazardous effects of climate change, but some groups are particularly vulnerable such as people living in low- and middle-income countries, small island nations and other coastal regions, megacities, and mountainous and polar regions. Other vulnerable groups include children, older adults, and those with underlying health conditions. Many of these groups live in higher rates of extreme poverty with few sources of support to adapt to a degraded, and climate-modified environment, let alone deal with the health consequences of these changes.

Main contributors to global climate change are fossil fuel combustion and industrial processes but also agriculture, deforestation and other land-use changes, transportation, and building energy use. In addition, the health sector is responsible for 4.6% of greenhouse gas emissions, with 70% coming from the health sector supply chain. Addressing this emission source is a critical need to meet carbon neutrality. A variety of co-benefits exist by mitigating emissions from the healthcare sector. Switching to renewable, distributed energy at hospitals and health centers, for example, can reduce GHG emissions, reduce air pollution, and generate money savings. Such a transition increases energy reliability as well, which can help facilities expand health service offerings and refrigerate temperature-sensitive medications.

Evidence suggests that the value of the health benefits of climate change mitigation has the potential to offset most of the initial mitigation costs. Successful policies and practices to address climate change mitigation and health require systematic, well-planned collaboration and decision-making between relevant sectors.

| OBJECTIVES

The objective of this session is to share practical lessons and innovations for multi-sectoral policies and practices to improve understanding of and strengthen multi-sectoral action on climate change mitigation and health across regions, looking at the impacts of climate on health and the healthcare sector on climate. This session will explore the various potential leverage points, financing mechanisms, and collaborations needed to mitigate climate change, promote human health and well-being, and secure environmentally sustainable healthcare practices, looking toward solutions that enhance justice and equity for vulnerable and underrepresented groups.

Speaker

Modi Mwatsama

Head of Capacity and Field Development

Wellcome Trust
United Kingdom

Modi is Head of Capacity and Field Development for Climate & Health at the Wellcome Trust. She leads the Climate & Health programme's work to mobilise a global community of researchers, policy makers, practitioners, funders and the public who are able to undertake, understand, fund and/or utilise evidence to put health at the heart of climate action. She joined the Trust in 2018 as Senior Science Lead for Food Systems in the Our Planet, Our Health Programme. Prior to Wellcome, Modi was the Director of Policy and Global Health at the UK Health Forum. Her work focused on research, advocacy, and policy-development for the prevention of non-communicable diseases across UK, European and global policy institutions. Modi is a Registered Nutritionist and has a Doctorate in Public Health from the London School of Hygiene and Tropical Medicine which examined public health policy processes.
